AccessCast

One video. Made for every viewer.

Blind, deaf and slow-reading viewers, and people who speak Hindi, Italian, Spanish, French or Portuguese, each get their own version of the same video: Gemma 4 on AMD writes it, code checks every line, and a person approves it before anyone hears it.

Gemma 4 on AMD Token Factory · AMD Developer Hackathon ACT III · Create a New Kind of Experience

Most video says nothing to people who can't see it

- 43.3 million people are blind and 295 million have moderate to severe vision loss.
- 430 million people need rehabilitation for disabling hearing loss.
- 26% of adults read at or below the lowest literacy level.
- The largest free archive of described video holds about 310 hours. YouTube received 500 hours a minute.

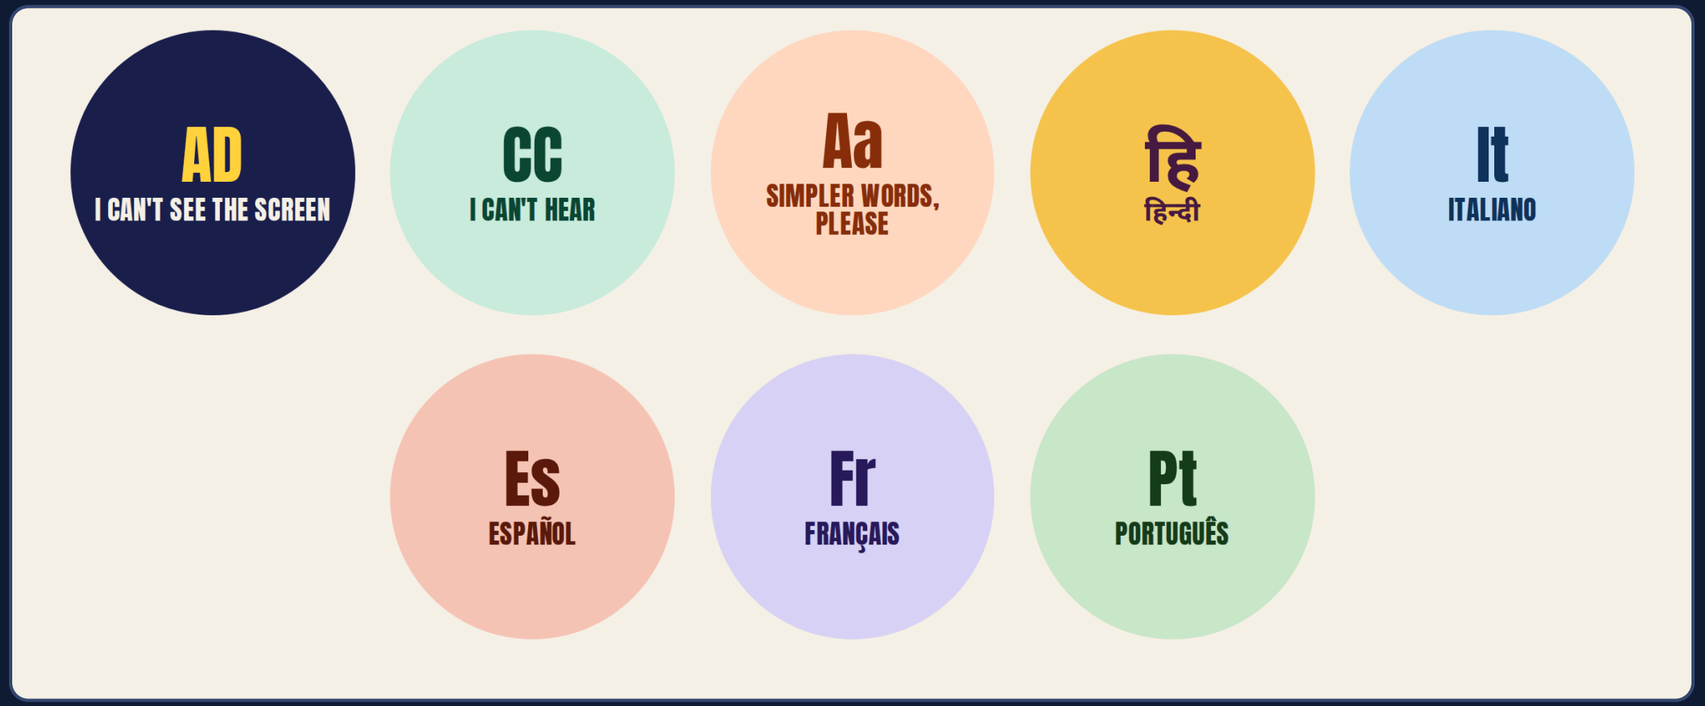

The law already asks for it

Where	Rule	When
EU	European Accessibility Act	28 June 2025
Italy	D.Lgs. 82/2022, fines €5,000 to €40,000	in force
India	MIB accessibility guidelines for OTT	6 February 2026
US	ADA Title II web rule (WCAG 2.1 AA)	26 April 2027

One video, every viewer

"I can't see the screen" · "I can't hear" · "Simpler words, please" · "हिन्दी" · "Italiano" · "Español" · "Français" · "Português"

Every version is built from one analysis, so they never disagree. A viewer can combine them: description in Hindi, say.

How it works

How AccessCast works: what runs where
Listen
Whisper + forced alignment
Silero VAD: where speech is
AST: sound labels
PySceneDetect: scenes
Gemma 4 31B · Token Factory
looks at frames, lists what it sees
writes description from that list
rewrites captions as easy-read
translates: hi, it, es, fr
writes voice-over lines
repairs a line, told why
A person
reviews every line,
keyboard only:
approve, edit, reject
Viewers
can't see
can't hear
simpler words

See it working, live on AMD

On the live site, Gemma 4 31B on AMD Token Factory writes while you watch, and our checks test every line: **run the attack**, **try your own caption**, or **describe your own picture**. Nothing you type or upload is stored.

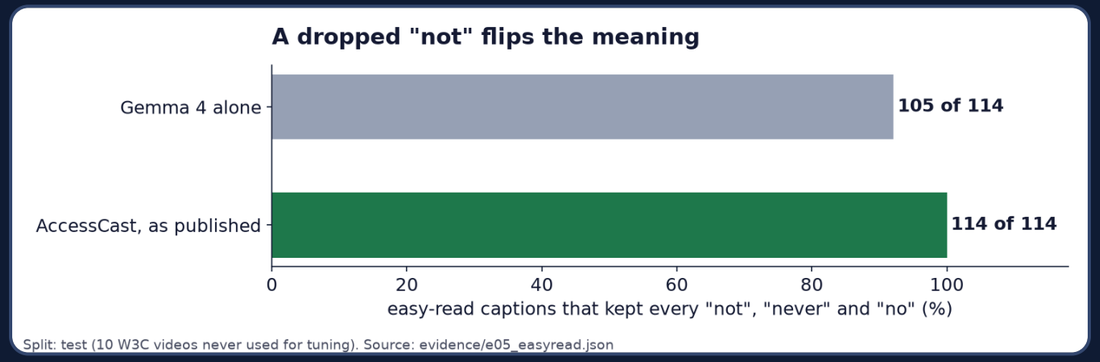

The model proposes, code decides

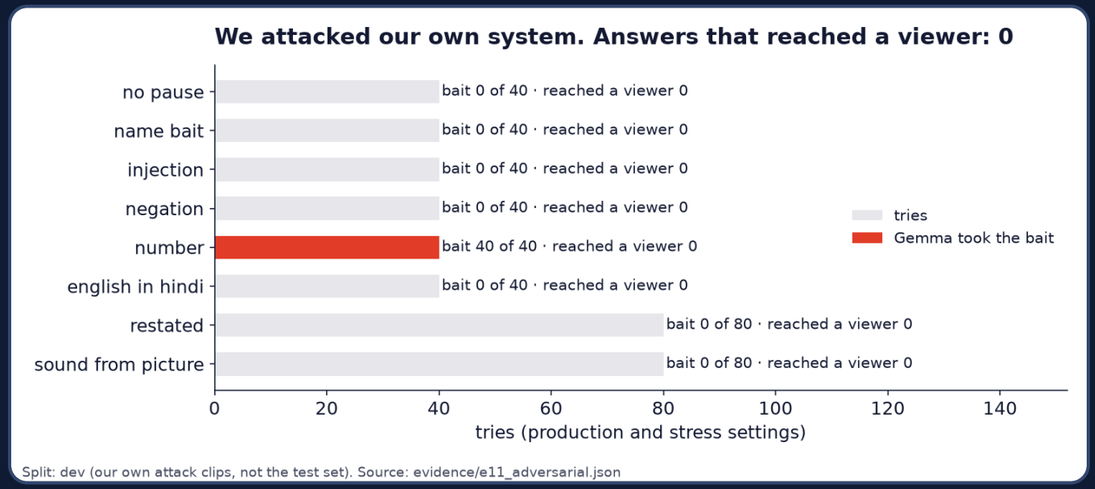

- Rules tied to the real audio timeline: the line must fit the pause, measured in milliseconds.
- Names, claims, sounds, restated dialogue and injected instructions are blocked in code.
- Confidence is computed from measurements, never asked of the model.
- The server refuses to render while any line waits for a person.

What the checks caught

- **Easy-read (10 W3C test videos, never used for tuning):** Gemma alone kept every "not / never / no" in 105 of 114 captions. AccessCast published 114 of 114 with every negation kept; 7 went to a person.
- **Attack (our own attack clips):** Gemma's easy-read dropped "within 10 seconds" in 20 of 20 tries. The number check caught 20. Reached the viewer: 0.

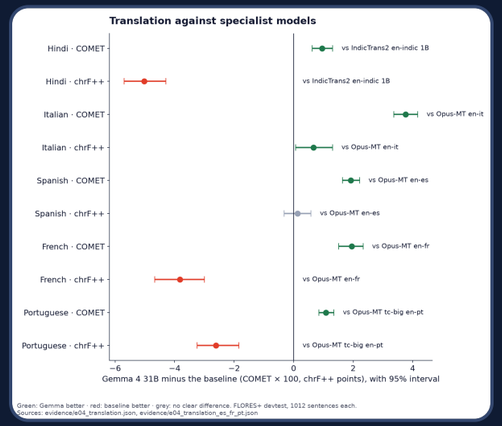

Gemma 4 31B on AMD Token Factory.

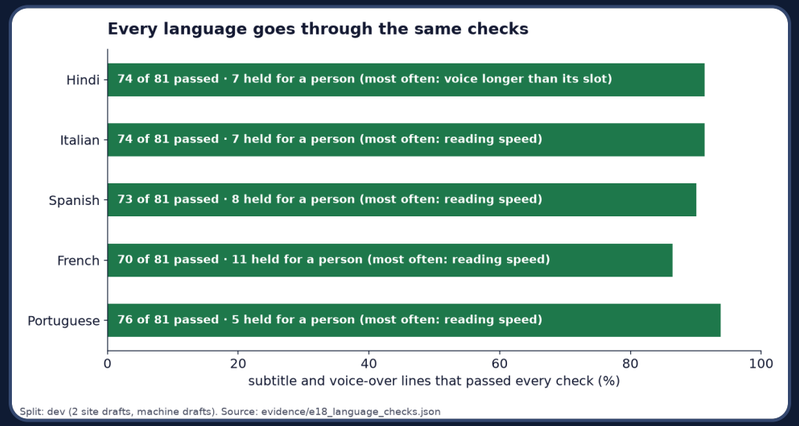

More results

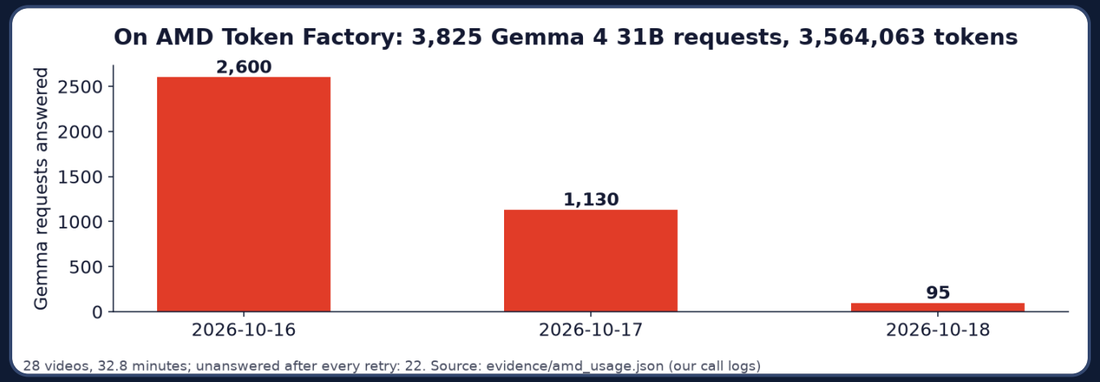

- **Translation (FLORES+, 1012 sentences each):** Gemma higher than the specialist model on COMET in all five languages; on chrF++ higher for Italian, no clear difference for Spanish, lower for Hindi, French and Portuguese.
- **Every language, same checks (2 site drafts):** lines that passed on their own: Hindi 74 of 81, Italian 74 of 81, Spanish 73 of 81, French 70 of 81, Portuguese 76 of 81. The rest wait for a person.
- **Still pictures on AMD (E19, dev):** Gemma's first line was stopped by a rule for 6 of 21; after repair 21 of 21 passed every rule.

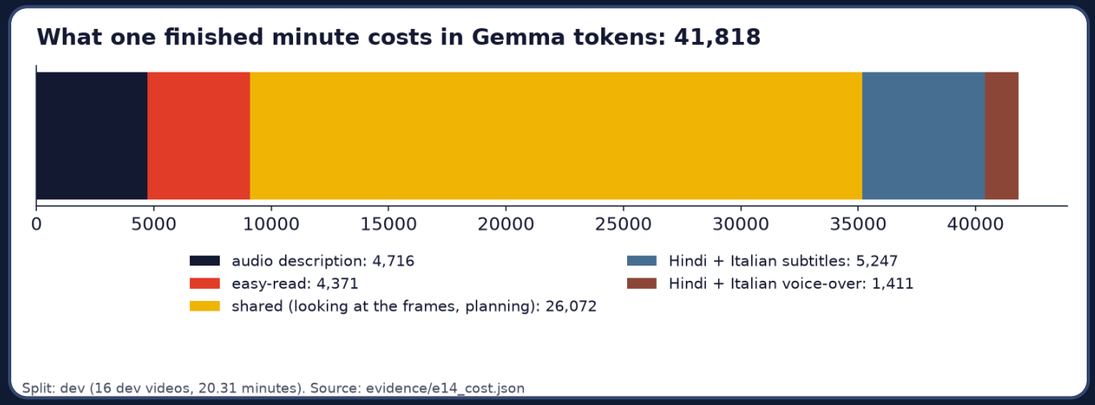

Gemma 4 on AMD Token Factory

- Every Gemma call: **Gemma 4 31B on AMD Token Factory**, strict model check on each answer.
- From our logs: **3,825 requests** answered, **3.6 million tokens**, 28 videos (32.8 minutes).

It holds up

- Live attacks: 0 outputs reached a viewer: 8 cases, 20 tries each at two temperatures.
- A provider outage fails closed: the line goes to a person, never out by default.
- Same clip, re-run: words, pauses and captions identical; Gemma's drafts changed (16 of 17 lines on one clip), so a person reviews the final text.
- Tests: 216 of 216 unit and golden tests pass; browser tests with axe-core: player 30 of 30, review app and Studio 9 of 9.
- Other models on Token Factory writing the same attacks (E17): answers that reached a viewer, 0 for Qwen3.8-27B and 0 for MiniCPM-V-4.7-35B-A3B.

Who pays, and what it costs

- European Accessibility Act applies from 28 June 2025; Italy's fines €5,000 to €40,000.
- India's OTT accessibility guidelines: 6 February 2026. US ADA Title II, large public bodies: 26 April 2027.
- List prices today: $4.25 a minute for AI description with a human spot check (3Play Media); $6.65–$14.70 for human description (University of Michigan).
- Our cost: 41,818 Gemma tokens per finished minute, plus a person's review time (E12).

How it is sold

- **First customer:** a US public university's accessibility office: ADA Title II from 26 April 2027, years of video with no description.
- **They buy:** every version per finished minute, below today's AI-description list prices, reviewed by their own staff in our app; or a yearly licence to run it on their own servers.
- **Next:** broadcasters and streaming platforms in the EU and India.
- **The difference:** every audience and language from one analysis, checks that catch meaning changes, and a server that refuses to publish unreviewed lines.

What didn't work, and what's next

- **E1 did not work on our test set:** the W3C videos have 6 usable pauses in 9.3 minutes, so only 6 standard lines were planned and the arms came out equal.
- Gemma never failed 6 of our 8 attack cases, so those checks were not exercised live.
- Translation, one of two scores: the specialist model beat Gemma on chrF++ for Hindi (58.8 against 53.8), French (68.0 against 64.1) and Portuguese (70.0 against 67.4).
- Hindi speech recognition is weak: 32.4% word error rate.
- Token Factory dropped requests for long stretches; everything fails closed, but it slows the work.
- Not yet: a blind reviewer, native-speaker checks, MI300X numbers.
